# Why is a PU Foam Critical Regarding Emanations ?

$\mu$ CT-reconstruction of a HR slabstock foam

# VOC / FOG Definition's

VVOC: < 0 ... 50-100°C

VOC : 50 - 250 °C

SVOC: 240 - 400°C

POM : >380°C

VVOC: Very Volatile Organic Compounds

VOC: Volatile Organic Compounds

SVOC: Semi Volatile Organic Compounds

POM: Particulate Organic Matter

## EU definition:

substances with a vapor pressure of  
> 0.01 kPa at 293.15 K

➔ PU Flexible Foam Industry has taken actions

# Conclusion Regarding PUR Foam

- Fogging Problem: - driven by technical / scientific considerations
  - many solutions have been developed during the last years
- VOC discussion in Comfort Market: - driven by external factors, not necessarily scientific
  - technical solutions for current labels / limit values are available
- Focus on toxicological & scientific evidence would be really helpful
- PUR foam producers & raw material suppliers were able to reduce emanations significantly
- Often is the usage of low-emanation raw materials also a question of commercial considerations. „Is the customer willing to pay for it ?“
- Low emanation PUR foam is able to compete in respect of VOC with many natural products
